Executive Summary: Instructor Performance and Course Quality on EduPro

Purpose

This study examines instructor ratings, course quality, and recorded enrollments to support evidence-based quality improvement on EduPro. The analysis covers 60 instructors, 60 courses, 10,000 transactions, and 887 unique instructor-course pairs.

Key Findings

- Average instructor and course ratings were **3.13 and 3.10 out of 5**, respectively.
- Teaching experience was positively associated with instructor ratings (**correlation: 0.598**), but showed almost no linear relationship with linked course ratings.
- Marketing had the highest course-category average (**3.72**), while Machine Learning had the lowest (**2.66**). Advanced courses averaged **2.81**, below Beginner and Intermediate courses.
- Two instructors accounted for **60.86% of recorded enrollments**, strongly influencing comparisons of demand across instructor rating tiers.

- All courses were linked to multiple instructors. Their shared ratings cannot establish individual teaching effectiveness.

Recommended Actions

Prioritise reviews of lower-rated courses and investigate learner feedback, content structure, and assessment difficulty. Collect instructor-specific course feedback, review counts, and learning-outcome data to improve evaluation. Provide training based on confirmed teaching needs and investigate the reasons behind enrollment concentration.

Implications for Stakeholders

The findings support more transparent quality monitoring and better targeting of improvement resources. They provide descriptive evidence rather than proof of causal effects. The deployed Streamlit dashboard will allow users to explore results through filters and track updated data.
